H	Additional qualitative results	89
H.1	Description of left-wing Creuse and Dordogne	89
H.2	“Moral” motivations among left-leaning groups (full results)	89
H.3	Description of right-wing Doubs and Vosges	92
H.4	“Material” motivations among right-leaning groups (full results)	92

H.5	Network: Insurgents recruit civilian helpers (full results)	94
H.6	Skills: Insurgents forge documents and organise evasion (full results)	94
H.7	Counterinsurgency and reprisals in provinces with many Jewish victims: “deviant” Dordogne, Vosges, and “typical” Gironde	95
I	Scope conditions (extended discussion)	97
J	Alternative model with Jewish insurgents	99

A Additional figures and tables

Figure A1: Configurations of balanced triads of Nazi Germans, Jews, and insurgents

Note: A diagram representation of all possible configurations of balanced networks of the Nazi Germans (N), Jews (J), and La Résistance insurgents (I). Sign “+” stands for a positive, and sign “-” for a negative sentiment.

Figure A2: Explanatory variable: La Résistance members by place of birth

Number FFI and FFC insurgents per 1,000 inhabitants (logged)

Note: Units are counties (“cantons”) by their 1940 boundaries (Gay, 2021).

Figure A3: Instrument: WWI military victims by place of birth

Note: Units are counties (“cantons”) by their 1940 boundaries (Gay, 2021). Gray areas are counties in Alsace-Lorraine region that did not form part of France before 1914.

Figure A4: Division of France into military Résistance regions

Source: Musée de la Résistance en ligne (AERI, 2004).

Figure A5: Covariate balance test of WWI soldier death rates on pre-WWI variables (ignorability assumption)

Note: The figure displays OLS coefficients with robust standard errors. Units of analysis are 1940 counties. All specifications include district-level fixed effects and spatial controls (area size, longitude, longitude squared, latitude, latitude squared) to account for spatial autocorrelation. The errors are clustered at military bureau and displayed as confidence intervals. The electoral specifications (1914) involve 2,847 observations (data from Cagé et al., 2023); WWI battles specifications involve 2,912 observations (data from Cagé et al., 2023); 1872 census specifications involve 396 observations (data from Squicciarini, 2020); Other historical specifications involve between 1,303 (average household expenditure) and 1,938 observations (total number of schools and share of catholic schools) (data from Squicciarini, 2020). See Tables A13-A16 for results in table format.

Figure A6: Covariate balance test of post-WWI variables on WWI soldier death rates (exclusion restriction assumption)

Note: The figure displays OLS coefficients with robust standard errors. Units of analysis are 1940 counties. All specifications include district-level fixed effects and spatial controls (area size, longitude, longitude squared, latitude, latitude squared) to account for spatial autocorrelation. The errors are clustered at military bureau and displayed as confidence intervals. The electoral data stems from Cagé et al. (2023). 1919 election specifications involve 2,864 observations; 1924 election specifications involve 2,796 observations; 1932 election specifications involve 2,459 observations; 1936 election specifications involve 1,980 observations; and collaboration specification involves 2,912 observations. See Tables A17-A20 for results in table format.

Figure A7: P-values of reduced-form specifications by maximum number of insurgents in county (DV: count of victims) (exclusion restriction assumption)

Note: The figure displays p-values of the WWI victimisation rate variable from OLS regressions with robust standard errors. The vertical lines refer to the 25th percentile and median distributions of insurgents. The x-axis is truncated. All specifications include the standard minimal controls from main models. The lines stand for lower 25th percentile (N = 767) and median (N = 1470) densities of insurgents. See models 1 and 2 in Table A7 for results of the 25th percentile regression in a table format.

Figure A8: P-values of reduced-form specifications by maximum number of insurgents in county (DV: proportion of victims) (exclusion restriction assumption)

Note: The figure displays p-values of the WWI victimisation rate variable from OLS regressions with robust standard errors. The vertical lines refer to the 25th percentile and median distributions of insurgents. The x-axis is truncated. All specifications include the standard minimal controls from main models. The lines stand for lower 25th percentile (N = 767) and median (N = 1470) densities of insurgents. See models 3 and 4 in Table A7 for results of the 25th percentile regression in a table format.

Figure A9: Distribution of p-values in 1,500 simulations of random samples of reduced form specifications (25 percent of total sample size). Outcome: Number Holocaust victims.

Note: P-values associated with robust OLS coefficients of variations of specifications with controls (Table A7, model 1). The vertical line stands for the p-value of 0.05.

Figure A10: Distribution of p-values in 1,500 simulations of random samples of reduced form specifications (25 percent of total sample size). Outcome: Proportion Holocaust victims.

Note: P-values associated with robust OLS coefficients of variations of specifications with controls (Table A7, model 3). The vertical line stands for the p-value of 0.05.

Table A1: Descriptive statistics of the main variables used in the analyses

Statistic	N	Mean	St. Dev.	Min	Median	Max
All Jewish victims	3,068	25.2	219.3	0	1	6,826
Deported Jews	3,068	25.0	219.2	0	1	6,826

¹Interpreting the results of the regressions with number of victims in the dependent variable indicates that one percent increase in the density of insurgents led to between 1,597 and 1,717 less victims. The coefficients of 2.234 and 3.259 % relate to a mean number of 25.2 Jewish victims in a county; $25.2 \times 0.0234 \times 2912$ units of obs. = 1717; $25.2 \times 0.03259 \times 1945$ units of obs. = 1597.

B Additional review of the extant literature

B.1 Existing explanations of survival in genocide

The scholarship on genocide has analysed the survival of the persecuted through three lenses: the perpetrator's strategy and motivations, the actions of civilian rescuers, and the agency of the victims. Here I briefly summarise these theories.²

The literature on perpetrators has analysed perpetrator states, networks and individuals. Potent states have been showed as indispensable tools for initiating and carrying out the immensely costly "genocide policy" (Marrus and Paxton, 2019; Straus, 2006). In the Holocaust, the strength of Nazi oversight correlated with the regime types that Germany installed across Europe, which moderated national collaboration and officials' persecution zeal (Fein, 1979; Seibel, 2002; Sémelin, 2018). Populous, close-knit societies with wide-reaching administrations (McDoom, 2020; Straus, 2006) and civil society networks (Satyanath et al., 2017) were showed as capable of quickly recruiting perpetrators, thus greatly affecting the speed and spread of violence. The study of individuals demonstrated that the majority of the perpetrators are "ordinary men" who, under coercive authority and motivated by fear of personal survival or reputation and financial gains, can be recruited into becoming executioners (Arendt, 1963; Browning, 2001; Milgram, 1963; Straus, 2006; Waller, 2007).

History scholarship on rescuers in the Holocaust concentrated on the altruistic hiding of the Jews by non-Jewish ("gentile") networks and individuals (for a review see Brethour, 2019, 11). It pointed out the existence of common traits among the rescuers, such as independence, high regard for ethical values and low risk aversion (see e.g., Fogelman, 2011; Monroe, 2013; Oliner and Oliner, 1992; Paldiel, 1993; Tec, 2013b). Sociologist Braun (2016, 2019) investigated the relative effectiveness of rescuing and found that, motivated by compassion, small religious minority hubs are particularly efficient at providing help. This is due to their strong intragroup ties and the resulting trust that insulate them from the risk of infiltration.³

The study of victims' decision-making in the face of mounting danger showed how "information," familiarity of Jews with Nazis' true intentions, propelled the victims to escape the Nazis on time (Finkel, 2017), and how previous clandestine experience ("resister's toolkit") facilitated the conception of Jewish resistant networks (Finkel, 2015). Survivors' memoirs and analyses of the breadth of rescue networks evidenced it was primarily the Jews' extraordinary resourcefulness that allowed them to seek help from multiple individuals at a time (Düring, 2015; King, 2020; Paulsson, 2002; Varese and Yaish, 2000).⁴ Even if the persecutory conditions by and large precluded the organization of Jewish military "resistance," the individual

²For a comprehensive theory of genocide see Straus (2015, 54–88). For theories of genocide onset by macro, meso and micro levels, see the review by Finkel and Straus (2012).

³Braun (2018) provides additional convincing evidence that such heightened capacity for rescue could extend to various types of minority hubs, including ethnic and political minorities.

⁴For individual memoirs that exemplify rescuing difficulties in urban centres see, e.g., Simon (2015); Tec (1984).

Jews’ “resilience” resulting in an array of survival strategies was the norm (Tec, 2003, 2013a).

B.2 Additional evidence from History scholarship

Croes and Tammes (2004, 431-445) conducted the only other quantitative analysis of the effect of insurgent presence on the deportation rates of the Jews in the Holocaust. They examined the Dutch province of Overijssel and found a positive association. Similarly to the logic of the above-mentioned studies, the authors speculated that insurgent presence could have acted as a lantern attracting incumbent’s attention and resulting in more spillover violence; German security units *Sicherheitspolizei* flocked to Overijssel, which would have facilitated simultaneous tracking down of insurgents and Jews. However, I replicate their study in the subsection below and find that their results were either driven by problems with their empirical approach or the particularly ferocious character of the occupation of Overijssel.

Ostensibly, some historical evidence from France could support the theories that point to adverse effects of insurgents on the Jewish civilians. After all, in France, Jews were routinely branded as communists and treacherous insurgents, most famously on the notorious *Affiche Rouge* propaganda poster. They would therefore likely become supplementary victim of counterinsurgency and reprisal campaigns. Historical accounts do recount instances of such indiscriminate killings of civilians, including Jews, suspected of supporting insurgent units (Bruttman, 2003, 246-258). One particularly violent and famous example is that of a reprisal massacre in Saint-Amand Montrond from June 1944, during which the Jews were rounded up together with all other town inhabitants. While indiscriminate at the time of the capture, the Jews ended up experiencing a disproportionately greater violence compared to their ethnically French neighbours (Todorov, 1996). Unsurprisingly, the counterinsurgency and reprisal threats therefore do come up in some survivor testimonies,⁵ but such accounts pertain to the beginning and the end of the German occupation only (1940 and 1944); they do not analyse the entire span of the conflict and the average relationship between insurgent presence and Shoah victimisation.

B.3 The Holocaust in the Netherlands: Replication of Croes and Tammes (2004)

Flap et al. (2002) and Croes and Tammes (2004) are the only other scholars I am aware of who quantitatively explore how the presence of insurgents affected Jews’ survival in the Shoah. They study the case of the Dutch Overijssel province. In the Netherlands, up to 25,000 went

⁵Jacobson family hid in Velanne (Isère), but in May 1944 Gestapo started conducting roundups in the region: “We stayed there for several days, until the villagers asked us to leave, or otherwise they would denounce us. (...) Albert N. [hid us nevertheless,] in a context where the Germans and the collaborators were hunting relentlessly and ferociously the guerrillas, who were very active in these mountainous regions” (Michèle Frybourg cited in Lazare and Doulut, 2019, 103).

into hiding of whom approximately 16,000 survived; “[s]uch help was often organised via resistance groups” (Flap et al., 2002, 9). They expect those groups’ presence to have therefore decreased Jews’ victimisation. However, they find that the opposite was true: in Overijssel municipalities, the presence of insurgents correlated positively with Jews’ victimisation rates.

This positive result could have been due to the empirical approach (variable coding, reverse causality and/or omitted variable bias), or—as suggested by the authors—to the particularly fierce strategy of insurgent persecution in Overijssel. I will discuss these two potential explanations in turn.

B.3.1 Empirical approach

The variable used by Flap et al. (2002) and Croes and Tammes (2004) is constructed on the basis of two sources, Hilbrink (1989) who provides a measure summarising both surviving and executed insurgents but only for the 17 municipalities of Overijssel (Twente region), and—for the other 25 municipalities—Hilbrink (1998) who provides counts of only those insurgents who perished due to persecution. The authors’ finding represents therefore the compound association of survival with insurgents’ presence *and* victimisation.

Table B1 reports the replication results. In the first model, I use the same approach as the authors. I run a bivariate regression with normal standard errors, weighting the model by the number of Jews present in each municipality in 1942. I use the entire sample and do not log any of the variables. The other models represent an alternative specification applied to different samples. I run multivariate regressions of proportion of Jewish victims on the counts of resistance fighters, Jewish population and total population. I log all the variables due to their right-skewedness. Model 2 involves the entire sample, while models 3 and 4, the Twente and non-Twente samples, respectively.

The only model that turns out to be statistically significant is the identical replication, model

1.⁶ This significant, positive result is probably due to the non-logging of the variables in the model, which may exaggerate the impact of outliers in the data. The results of all other models point to lack of correlation between the two measures. This is also true for models 3 and 4 that estimate the impact of alternative codings of the main explanatory variable. Importantly however, these null results can be due to the tiny sample sizes. Another problem is that the analysis likely suffers from the omitted variable bias. Enlistment to the insurgency correlated with, i.a., state presence and ideological attitudes. Moreover, the victimisation of the Jews co-varied with the persecution of the insurgency and other minorities. The authors also point out another potential problem, that of reverse causality, “The high level of resistance could be a reaction to a relatively high degree of local persecution of the Jews earlier” (Croes, 2006, 493). The results should therefore be interpreted with caution.

B.3.2 Case particularity

The deportations in the whole province of Overijssel were supervised by one and the same entity, Sipo and SD Aussenstelle in Arnhem. Thus, using the sample of this one province, it is not possible to assess the main result under different persecutory strategies (also conceded in Flap et al., 2002, 10). Noteworthy, the level of persecution of Jews and insurgents in Overijssel was high and started comparatively early. If the true result of the insurgence presence on Jews’ victimisation in Overijssel was indeed positive, it could also mean that the strategy of Sipo/SD Aussenstelle in Arnhem was harsh above the national average. In other words, Overijssel province would have been more similar to the French “deviant” Dordogne than to the “typical” Creuse. In fact, a counterexample to Overijssel could be the province of Utrecht. The idiographic evidence from Utrecht suggests that the resistance formation was similar than elsewhere, but the counterinsurgency and searches for the Jews were delayed (Croes and Tammes, 2004, 471-483). The Jews’ victimisation level in Utrecht was also one of the lowest in the country.

⁶However, the coefficient is not exactly the same as the original one of -4.96 with the standard error of 1.70.

C Additional background information

C.1 La Résistance's attitude towards the persecution of the Jews in France

In the underground press we find some expressions of anti-Semitism in a publication by the conservative *Cahiers (OCM)* (Marrus and Paxton, 2019, 137-138), although pro-Jewish articles appeared in other newspapers such as the centre-left *Libération*,⁷ the left-wing *Combat*,⁸ and were aired on BBC.⁹

La Résistance leaders and the Free French movement advisers around De Gaulle were primarily focused on the liberation of the French territory from the Nazi German occupation (Marrus, 1989, 3-12). Their reluctance to take an official stance towards Jews' persecution was due to their own ideological divisions (Marcot, 2006, 895-898), and the fear of antagonizing the civilian population, given the widespread anti-Semitism at that time (Hamon and Poznanski, 1992; Poznanski, 2012, 14, Marrus and Paxton, 2019, 137). Henri Frenay, a founder of one of the biggest groups, Mouvement de Libération Nationale, made clear that La Résistance's goals would not cater to Jews' particular needs in a speech in November 1940: "All those who will serve in our ranks, like those who are already there, will be authentic Frenchmen. Jews will serve in our ranks if they actually fought in one of the two wars" (Frenay cited in Poznanski, 2008, 195).

C.2 Different discrimination of French and foreign Jews in France

The survival rates of French Jews differed starkly from those of the foreign Jews. While 88 % of French Jews survived the Holocaust, only 58 % of the foreigners did. Jews' deportation timeline under Figure C1 evidences that the foreign Jews were prioritised for the deportation until early 1943, after which the genocide rates dropped, targeting proportionately more French Jews.

Most of the French Jews with immigration background were denaturalised by the Law of 22 July 1940, making it easier for the Vichy government to motivate their murder. Details about differential discrimination including the denaturalisation policy which prepared ground for the extermination of Jews born outside of metropolitan France can be consulted in, e.g., Marrus

⁷An excerpt from February 1942 article: "The French must say it again and again, must shout it. Some want to reduce their homeland to the foulest barbarism. Thousands of poor souls are hunted down, arrested, starved, and killed, among other things, for the crime of having been born Jewish. The Israelite's situation in the occupied zone is a true hell." (*Libération*, Organe des forces de résistance française, 1942, 2)

⁸An excerpt from 1942 "Jews our Brothers" article: "Their martyrdom and their persecution makes them all the dearer to us. Everyone who suffers because of the Germans, whether Jewish or not, communist or not, is our brother." (*Combat*, 1942, 1)

⁹January 4, 1941: "The measures that struck the Israelites are therefore only the prelude to more general measures. (...) Oppose the insidious propaganda that prepares your enslavement through division by showing national solidarity, without distinguishing by origin or belief." (BBC French Transcripts, Institut d'histoire du temps présent B69, cited in Poznanski, 2008).

D Additional information to “Data: Sources and Measurement” Section

D.1 Predicting wartime Jewish presence

There is no register of prewar Jewish population in France due to the French constitutional principle of “laïcité” (secularism). At any rate, such register would misrepresent wartime ethnic composition of France, because Jews migrated on a massive scale—internally and abroad—especially at the beginning of the war. The best example of how unprecedented the exodus was is the case of Alsace-Lorraine region. All the Jews who lived there were forced to leave their homes and were resettled to the Massif Central region (e.g., Reviriego, 2003). While the ethnic French population did go back to their homes after the terms of the armistice were concluded, Jews by and large did not. I therefore decide not to attempt the estimation of the prewar Jewish population in France.

Instead, I gather census province-level data from Klarsfeld (1983) ($N=229,577^{10}$ across 90 provinces) and employ an OLS prediction model to allocate people across the province-nested counties. Firstly, I run a province-level regression of Jews’ wartime presence on chosen covariates to determine influential predictors. I then use the resulting coefficients to compute county-level weights that are used to distribute the populations. The final model uses predictors of (1) prewar population estimates that I code manually from “The Encyclopedia of Jewish Life before and during the Holocaust” (Spector and Wigoder, 2001) (382,999 individuals across 97 localities), (2) total population figures from the 1936 census, (3) the difference between 1936 and 1931 population figures that captures—among other demographic changes—the Jewish migration from Germany and some parts of Eastern Europe, (4) number of synagogues, (5) political and military posts as of December 1940 (see DHI database described in the main text), (6) kilometres of railway as of 1922 (Pengl et al., *ming*), and (7) mean elevation (NASA, 2013).¹¹ To make sure that thus-generated predictions are reliable and that my main results are not due to an erroneous distribution of the population, I conduct two placebo tests.

Firstly, I randomly allocate the population values across the province-nested counties and run my main model with thus-specified dependent variable. I do it to check how consequential it is to approximate the true population distribution. I repeat this exercise 1,500 times. The results of this test are displayed in Figure D.1. It turns out that less than five percent of thus-specified models return statistically significant results on my main independent variable—a proportion that is expected due to chance. This means that not any distribution will do. In order to conduct a valid test of the existence of the theorised relationship I need to approximate the

¹⁰The number is lower than the prewar 330,000 estimate, because the Nazi census disregarded children (involved people of 15 years old and above) and did not include the Jews who managed to flee abroad in 1940.

¹¹In some counties, thus-estimated total Jewish population turns out to be 0. To deal with the zeros in nominator and denominator I therefore use the log of $\frac{(\text{number victims}+1)}{(\text{allocated Jewish population}+1)}$. In some counties the estimated population is lower than the number of victims. I do not adjust these estimates post-hoc.

Figure D1: Distribution of p-values in 1,500 simulations of alternative denominator specifications. Specifications based on random allocation of Jewish populations across the counties.

Note: P-values associated with 2SLS coefficients of variations of fully controlled base specifications (Table 2, Model 4). The vertical line stands for the p-value of 0.05.

Table D1: OLS regressions of predicted and evenly-distributed values of Jews' presence on the logged number of Holocaust victims

	(1)	(2)	(3)	(4)

* p < 0.1, ** p < 0.05, *** p < 0.01

true distribution of the Jewish population across France.

Secondly, I therefore check whether my estimation approximates this true distribution by comparing its prediction power with an alternative, even allocation. Jews' presence depended on social ties, risk appreciation and economic conditions, so we know that an even distribution is an imperfect approximation. However, if the province-level data is of good quality, we should expect the even distribution to reflect to some extent the Jewish presence independently of the error. Table D1 shows simple binary correlations (columns 1 and 3) and correlations in models with basic controls (columns 2 and 4). All the variables in the model except for the dummy "synagogues" and the longitude and latitude controls have been log transformed. If either of the Jewish population measures approximates the true distribution, we would expect it to be correlated with victim statistics.

The results suggest that both measures are very strongly and substantively associated with victim statistics even when controlling for total population figures and presence of a synagogue. Similar substantive significance levels and R-squared statistics across both measures suggest that the predicted measure fares similarly to a simple "even" distribution. These results are reassuring, because they show that the gathered province-level data on Jews' presence

are of high quality. Importantly, I cannot use the even distribution in my main models as one of my strategies for handling unobserved heterogeneity is to include district-level fixed effects in my specifications. Due to perfect multicollinearity, thus-specified Jews' presence would be effectively dropped out of the model and prevent me from estimating the main relationship of interest. It is therefore important to know that the proposed predicted measure is similarly accurate to the "even" alternative, while at the same time offering the advantage of being econometrically usable.

I am therefore assured that my prediction approach not only approximates the true distribution of Jewish wartime population, but also that my main results are not due to chance.

D.2 Assigning Jewish ethnicity to La Résistance members

To classify La Résistance members as either Jewish or gentile, I match insurgents' surnames against the records of the Avotaynu platform (Sack and Mokotoff, 2004), which gathers historical and contemporaneous genealogical records of Jews from around the world. I search each

Note: Results of the surname matching exercise, conditional on the step-wise classification of the French surnames as Jewish, by surname popularity. Matching was performed against Avotaynu internet search engine. The value of "0.00" on the X-axis corresponds to the complete exclusion of all insurgents initially classified as Jewish who bore French surnames. The resulting estimation of 2 percent corresponds to all foreigner fighters among La Résistance ranks who were classified as Jews. The value of "1.00" on the X-axis signifies that all insurgents with French surnames are included, which results in the estimate of 34 percent of Jewish insurgents among La Résistance. The value of 0.99 excludes only the most popular French surnames, such as "Dupont" or "Martin."

surname (190,000 unique values) in the Jewish names' search engine that contains 700,000 Jewish surnames gathered from across 42 databases. I assign the Jewish ethnic status to all exact matches that appear in more than one database. In the next step, to make sure I do not commit the Type I error by over-assigning the Jewish ethnic status to people with surnames commonly shared by both Jews and non-Jews, I discard all matches that were common surnames in WWII France. To construct the measure of the surname popularity, I summarise the frequency of surnames given at birth to people born on the territory of France between 1891 and 1940. To do that, I use the birth records of the Insee Institute (INSEE, 2018). Figure D2 shows the results of the exercise.

Given my reliance on the insurgents' surnames uniquely, it is difficult to ascertain the true proportion of Jews among La Résistance ranks as there are no official statistics of their involvement (Diamant, 1962; Poznanski, 1995). While the estimate of 34 percent relative to the point "1.00" on the X-axis surely contains Type I error as it classifies as Jewish also those insurgents who bore surnames typical for non-Jews, but also sometimes borne by Jews (e.g., "Dupont" or "Martin"), the exclusion of all typical surnames inevitably ends up dismissing typically Jewish surnames as well, producing the Type II error. Thus, e.g., the 98th percentile on the X-axis (14 percent estimate) excludes from the list all insurgents who bore the typically Jewish surname "Lévy." Michel (1970, 191) suggests in fact that participation of Jews in La Résistance was higher than that of any other religious or ethnic group. I cautiously conclude that the true proportion falls somewhere between 5 and 15 percent. This is significant if we consider that Jews constituted only one percent of the prewar French population and that only approximately 1.5-3 percent of the French population joined La Résistance. In fact, this estimate might be conservative, because numerous surnames of foreign origin in the original database contain spelling errors while my matching strategy against the genealogical databases of Avotaynu includes exact matches only. Figure 3 in the article shows the distribution of the results by insurgent group. I use the conservative estimates respective to the 99th percentile results.

D.3 Assigning 1936 French election parties to left-right spectrum

I follow the below protocol developed by Cagé et al. (2023, Online Appendix):

- extreme left: *Parti communiste français*;
- left: *Parti socialiste - Section française de l'Internationale ouvrière*, miscellaneous left;
- centre-left: *Union socialiste républicaine* and *Radicaux Socialistes*;
- centre-right: *Alliance démocratique*, *Fédération républicaine - Union républicaine et démocratique*, *Parti républicain national*;
- right: *Parti agraire et paysan français*, miscellaneous right;

- miscellaneous “other” parties (baseline for comparison).

E Information about “Righteous Among The Nations Database” of Yad Vashem, The World Holocaust Remembrance Center

E.1 Data biases

The “Righteous Among the Nations” database of Yad Vashem contains a number of biases that are likely to result in making the Type II error, i.e., make me conclude that the insurgent involvement in the rescue was negligible and not statistically different from the civilian involvement. Firstly, the altruistic lens through which the applications for the Righteous title are screened precludes those applicants who provided services to the Jews in exchange for money. Since the services such as document forgery or evasion were often payable, the database will underreport those smugglers who were members of insurgency networks. Secondly, given an easier identification of rescuers who established longer-lasting relationships when *hiding* rescuees as well as the clandestine nature of illegal services such as document forgery and smuggling, the database will account for identifiable civilians who *hid* the Jews and underreport the people who concealed their true identities while helping the Jews in covert fashions. In fact, some of the testimonies explicitly mention the rescuee survivors learning only after the war that their helpers were insurgents. Nevertheless, assuming that the rescuer screening process is similar across countries, we can expect the internal validity of the classification to be high and allow us to learn at the very least whether: (1) there were (any) insurgents among the rescuers; (2) there are systematic differences in proportions of insurgents among the rescuer populations across the studied countries; (3) the insurgent rescuers helped the Jews in systematically different ways than civilian rescuers; (4) an average insurgent rescuer helped more or less Jews than an average civilian rescuer.

E.2 Text analysis of the rescue testimonies

Yad Vashem’s database of the people awarded the Righteous Among the Nations title includes descriptions of the rescuing acts carried out by each involved person. Each individual’s testimony consists therefore of a short biography of the Jewish rescuee, how they came into contact with the rescuer, how the rescuing unfolded, and what the fate of the rescuer was. Often, the descriptions involve more than one rescuer (e.g., a household) and more than one rescuee (e.g., an evading family). The corpus spans rescue locations in 28 European countries, United States and Tunisia. I classify the Righteous into three categories:

1. Insurgent rescuers (“insurgent”; N = 1,825);
2. Civilian rescuers who knew insurgents (“civilian in contact with insurgents”; N = 2,028);
3. Civilian rescuers who did not know insurgents (“unconnected civilian”; N = 11,447).

Figure E1: Results of classification of the Righteous by rescuer status and country of rescue

Note: The figure shows countries with at least 100 recognised Righteous.

I do so in two steps. First, I apply a dictionary rule to the corpus to identify testimonies which mention insurgency (N = 5,027); second, I read every such testimony to classify it into one of the three categories. Figure E1 shows the results of the classification by rescue country.

E.3 Dictionary rules

The following are the terms that make up the dictionary that serves me to identify which of the rescuers might have been connected with insurgent networks: “resistance”, “underground”, “partisan”, “secret army”, “armee secrete”, “brigade”; “groupe g”, “belge des partisans”, “partisans armes”, “front de l’indépendance”, “onafhankelijkheidsfront”, “milices patriotiques”, “solidarite”, “lutte syndicale”, “wallonie libre”; “maquis”, “mouvements unis de la resistance”, “unified resistance movement”, “liberation sud”, “liberation nord”, “franc-tireur”, “front national”, “comite d’action socialiste”, “organisation civile et militaire”, “ceux de la”, “ftp-moi”, “bcra”, “combat”; “garibaldi brigades”, “giustizia e liberta”, “justice and freedom”, “partito d’azione”, “matteotti”, “fiamme verdi”, “partigian”, “brigat”; “milorg”; “armia krajowa”, “armia ludowa,” “gwardia ludowa”; “yugoslav partisans”, “tito’s”, “national liberation army.”

E.4 Examples of classified profiles by type

For illustration, below are three randomly picked descriptions of people who were classified into different rescuer types.

A household classified as “insurgent,” Louis, Palmyre and Muguette Jouy

“Lazare Gonigberg of Bordeaux (Gironde) was arrested on July 17, 1942, and deported to the east, where he perished. Mothers of children who were under the age of two were spared. Gonigberg’s wife, Ida, and their two daughters, five-year-old Monique and one-year-old Annie, were, however, incarcerated in a hospital room with barred windows in Mont-de-Marsan (Landes). About five weeks later, they were released and ordered to return to their home in Bordeaux. Ida Gonigberg knew that she and her daughters had to escape before they were arrested again, so she hired Baboulet, a border guide who was a resident of Ribérac in the same département, to escort them past the demarcation line into the unoccupied zone. One night, Baboulet led the Gonigbergs across the fields. Ida clutched Annie and Monique walked next to her. When they reached Ribérac, Baboulet brought them to the Hôtel de France, which belonged to the Jouys. The Jouys, active Resistance members who were already sheltering several Jewish families and underground members who were wanted by the authorities, gave Gonigberg and her daughters a warm reception. They provided forged papers (furnished by the local gendarmerie) in the name of Brunet, room and board, and moral support, all at no charge. When Gonigberg insisted on reimbursing them, the Jouys suggested that this be deferred until after the war. Their daughter Muguette helped the Gonigbergs’ adjust to the hotel.

On November 10, German soldiers invaded Ribérac, ordered all the residents of the hotel to evacuate, and checked their documents at the entrance. Ida Gonigberg passed the inspection safely, and the Jouys persuaded the German soldiers that her daughters were their own. Immediately afterward, the Jouys arranged refuge for Gonigberg and her daughters with local farmers in Fontenillou. The German troops spent several days at the hotel, conducting field trials of merchants and artisans (bakers, grocers, garage owners) for supplying food and services to local underground fighters. As for the latter, those who were caught were summarily executed. The commander of the force, a French officer named de La Plana, was a collaborator and wore Nazi regalia. When de La Plana boasted to Louis Jouy “All your friends have been slaughtered,” Jouy assaulted and nearly killed him with his bare hands. When that travesty of justice was finished, the Germans left the hotel and the tenants returned. After a few months in Fontenillou, the Gonigbergs returned to the hotel and stayed there until the end of the occupation. After the liberation, de La Plana was prosecuted and executed. On June 13, 1991, Yad Vashem recognized Louis Jouy, his wife, and their daughter Muguette as Righteous Among the Nations.” (Yad Vashem, 2021, file M.31.2/4933)

A household classified as “civilian with connections to insurgents,” Paul, Marguerite and Armelle Jacquin

“Hélène Fraenkel, born in Karlsruhe, Germany, was twelve years old in April 1939, when her ordeal of afflictions and flight from the Germans began. She and her sister Emilie were smuggled into France with the assistance of the OSE and reached Strasbourg. When the Germans invaded France, Hélène Fraenkel was sent without her sister, again by the OSE, to an orphanage in Bergerac in the département of Dordogne in southwestern France. One night in 1942, French gendarmes raided the orphanage and arrested some of the Jews there. Fraenkel, who was already seated in the van, was replaced at the last moment by an older child. She was returned to the orphanage, but it was then decided to move her to a safer place.

The principal of the orphanage was in touch with a French family who lived in a chateau and administered the surrounding farms. The family had connections with the French underground, and sheltered Jewish children with forged papers. Thus, in 1942, Hélène Fraenkel arrived at the chateau of Cireygeol, which was owned by the Jacquin family. The Jacquins were an affluent family with five children, but they lived modestly as tillers of the soil, with the help of their children and their “guests.” The chateau was an ancient, spacious place, and the children helped with various farm chores, such as taking the sheep and cattle to pasture and bringing in the harvests. After the war, Hélène Fraenkel recalled the warmth of the Jacquin family, especially of their daughter Armelle, who was her age and lived in the room adjacent to hers.

Armelle Jacquin recalled Hélène as a strong girl who never shed a tear, although she was desperately in need of a human and warm relationship. Occasionally the Germans and French militia raided the area in search of Jews and underground fighters. When this happened, the Jacquins hid the older children in the thick of the forest and concealed Hélène under a haystack. The Jewish children on the farm were instructed not to disclose their Jewish identity to anyone, and only after the liberation did Hélène Fraenkel discover that the other children were also Jews. The Jacquins looked after Hélène for a year and a half after the liberation of the area. She was then sent by the OSE to an institution in Toulouse. On February 27, 1991, Yad Vashem recognized Paul and Marguerite Jacquin, and their daughter Armelle, as Righteous Among the Nations.” (Yad Vashem, 2021, file M.31.2/4873)

A household classified as “unconnected civilian,” Paul and Thérèse Fourtier:

“Léonce Karcher was born in the Alsace region of France in 1936 to Elise and Joseph Gintzburger. In 1938 his parents divorced, and his mother married Henri Karcher, a non-Jew who adopted Léonce, at which point the child began using the family name of Karcher.

In July 1940, when the Germans invaded, Léonce and his mother were visiting his grandmother Frédérique Hallel in Réguisheim

(Alsace). The Germans expelled everyone, along with many other Jews from Colmar. They all were sent to the south, but Henri was not allowed to join them. Elise found a job at a shoe shop in Chaumergy (Jura) and managed to rent a small place in Courbouzon (Jura) for herself, her son, and Frédérique. In 1941 Henri managed to escape the north and joined them. They stayed there until June 1942. During that time Elise befriended a neighbor, Thérèse Fourtier, who lived with her husband, Paul, and their two children, Michel and Marie. Thérèse and Paul were both from Catholic families and owned a little piece of land where they grew vegetables and raised animals for a living.

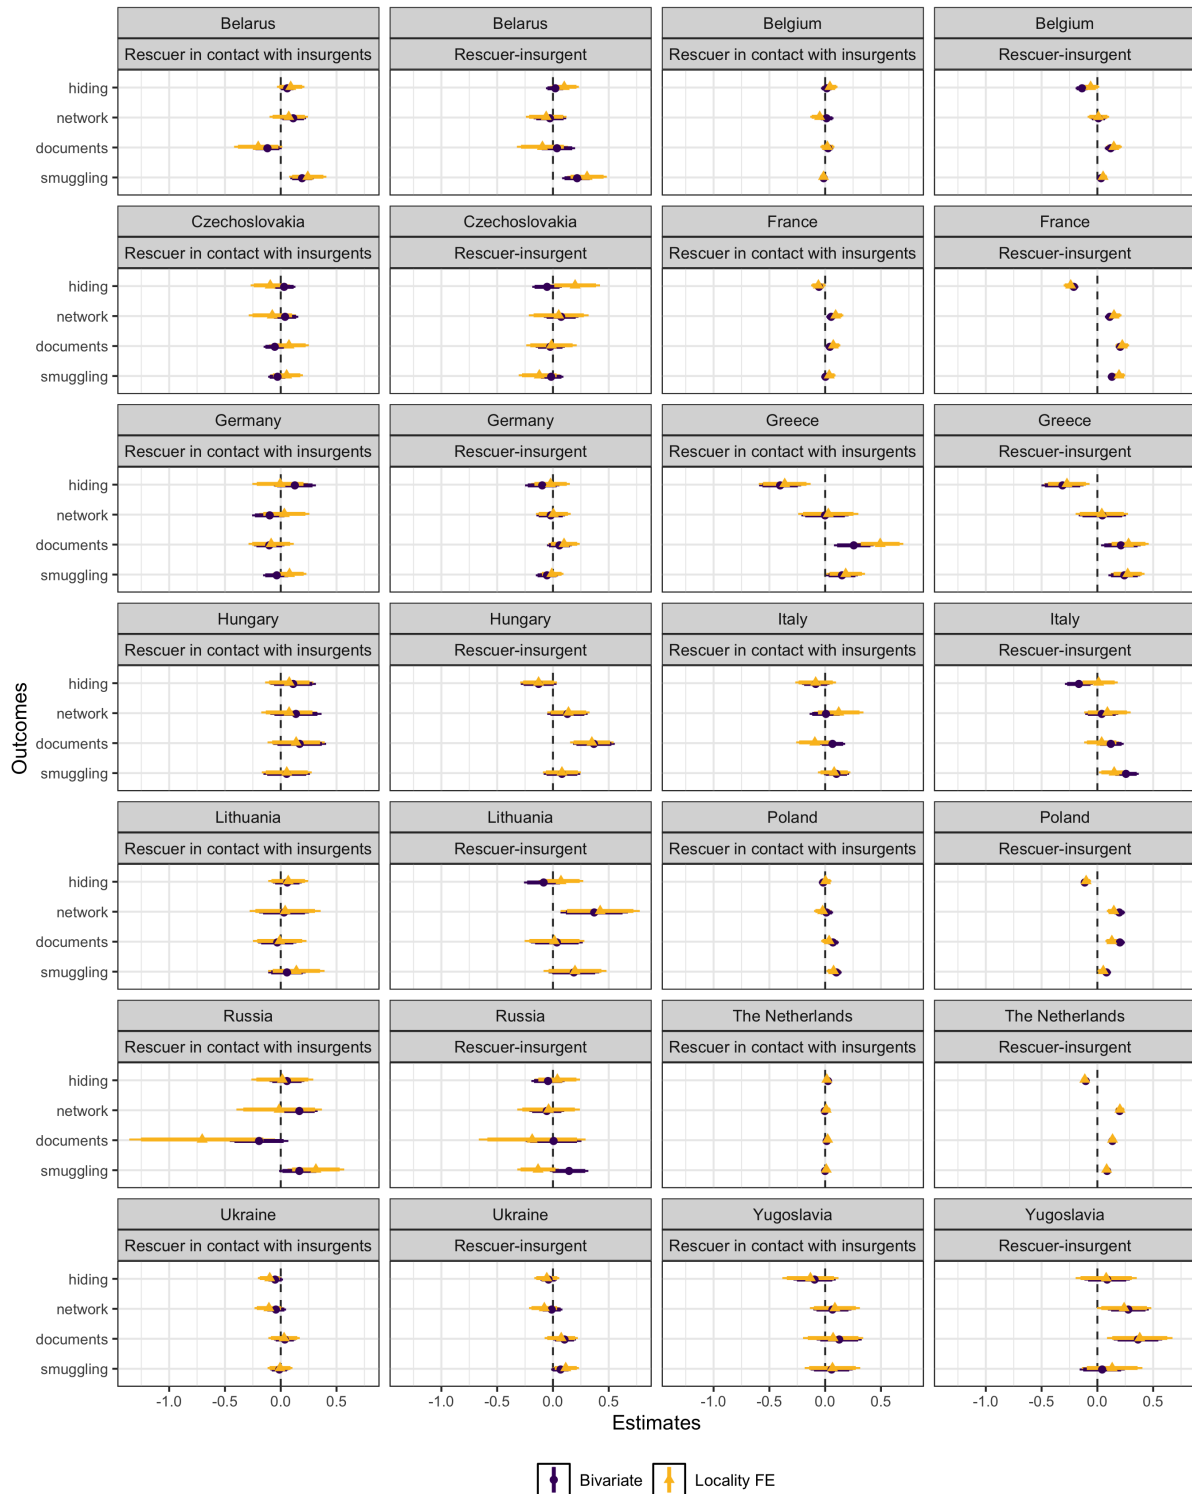

Thérèse offered to help Elise by renting her the two rooms on the first floor of her house in exchange for a very small income. This was much easier for the Karchers, who accepted the offer. In June 1942 they moved into the Fourtiers' house. Thérèse and Paul helped them on a daily basis, providing them with eggs, fruit, and flour. Michel Fourtier brought them water every day.

They also offered the Karchers a small part of their land where they could grow their own vegetables. The Karchers managed to live a normal life until November 1942: Léonce went to school, and his parents worked. In November 1942 the Germans invaded the south, which put the Karchers at risk of deportation, especially Frédérique, the grandmother, who had "Jew" stamped on her identity card. Henri, who was not a Jew, could keep his work, but the situation was risky. The Fourtiers arranged a system to warn the Karchers when searches were to be conducted in the area. One of the Fourtiers would come to warn them, and they would escape to a more isolated place not far away. Another one of the Fourtiers would come to fetch them when the danger had passed. In May 1944 the Germans came to the shoe shop and arrested the owner. Elise ran away immediately, leaving all of her things behind. When he learned what had happened, Paul Fourtier took his carriage and brought Frédérique, who was most at risk of deportation, to another hiding place in the village of Revigny, with another Catholic family. Elise and Léonce joined her, and they all stayed there until the liberation. After the war the whole family moved back to Réguisheim, but the contact with Paul, Thérèse, and their children stayed strong. Léonce wrote that "without the compassion and humanism of Paul and Thérèse, and without their support and disinterested help, I wouldn't be here to tell this story." On September 11, 2012, Yad Vashem recognized Paul and Thérèse Fourtier as Righteous Among the Nations." (Yad Vashem, 2021, file M.31.2/12374)

E.5 External validity: European Righteous Among the Nations

To probe the external validity of my findings, I extend my analysis of the French Righteous Among the Nations to entire Europe. I run linear probability models of likelihood of conducting specific rescue activities, by rescuer profile and country. Figure E2 presents the results. The results show that insurgent rescuers in most countries tended to carry out different help activities than civilian rescuers. More specifically, insurgents were less involved in hiding of Jews (Belgium, Greece, Poland, The Netherlands), but more involved in document forgery (Belgium, Greece, Hungary, Poland, The Netherlands, Yugoslavia) and organisation of evasion (Belarus, Belgium, Greece, Italy, Poland, The Netherlands, Ukraine). Additional OLS models of rescuer status on the statistics of rescuees by Righteous household types (Table E1) reveal that, on the European level, it was the insurgent rescuers who tended to help on average more people than both other groups (4.3 and 3.2 people, respectively).

Figure E2: Results of Linear Probability Analysis of likelihood of performing specific rescue activities, by rescuer profile and country (Europe)

Note: The analysis applied only to countries where at least 100 people were awarded the title of the “Righteous Among the Nations” (N = 14,425). Civilians without links to insurgents are baseline for comparison. Unit of observation are individual rescuers. See Tables A21-A33 for results in table format.

Table E1: OLS results of the Righteous rescuer status on number of Jewish rescues per rescuer household

	<i>Dependent variable:</i>		
	Number Jewish rescues (logged)		
	(1)	(2)	(3)
Rescuer in contact with insurgents	-0.097*** (0.014)	-0.012 (0.015)	0.040* (0.024)
Insurgent rescuer	0.008 (0.017)	0.079*** (0.017)	0.059** (0.025)
Constant	1.238*** (0.005)	1.517*** (0.085)	1.242** (0.497)

Note: Table presents OLS estimates. Robust standard errors in parentheses. Units of analysis are rescuer households. Baseline for comparison are civilian Righteous rescuer households.

F Additional information to “Method” Section

F.1 Spatial autocorrelation

Spatial autocorrelation is a serious concern in studies with geographical units of observation that try to assess relationships between phenomena over time (Kelly, 2020). To make sure that my results are not mere reflections of persistence of local conditions, I follow five steps.

As described in the main article:

1. In my regressions I include district-level (“arrondissement”) fixed effects (N=283). Districts are administrative units one level above counties. Due to high granularity, they are the hardest administrative measure I can account for.¹²
2. To account for the potentially adverse effects of directional gradients, I add longitude and latitude controls together with their squared variants.
3. I employ two-way clustering at the level of the assignment (county military bureau b that determined level and character of exposure to WWI violence and strategy; N=162) and the treatment (county Résistance military region r that determined leadership strategy and the resulting incentives and resources for helping the Jews; N=27).
4. I perform Moran tests to numerically assess the potential scale of the problem, even after the inclusion of the above controls. I find no spatial autocorrelation as the highest Moran statistic is only 0.015.

Additionally, to make sure that extreme values do not drive my results, I repeat my main specification model removing one resistance region at a time. Figures F1 and F2 show results of the test. Independently of which region is excluded, the main coefficient of interests remains statistically significant.

¹²See Tables A5 and A6 for additional specifications with province level-fixed effects (N=87).

Figure F1: 2SLS results removing one Résistance region at a time (assessing influential cases).
 Dependent variable: Number Holocaust victims (logged)

Note: The figure displays 2SLS coefficients. Units of analysis are 1940 counties. All specifications are replications of main results (see Table 3, column 4).

Figure F2: 2SLS results removing one Résistance region at a time (assessing influential cases).
 Dependent variable: Proportion Holocaust victims (logged)

Note: The figure displays 2SLS coefficients. Units of analysis are 1940 counties. All specifications are replications of main results (see Table 3, column 4).

G Discussion of the qualitative approach

I conduct case studies to investigate the causal mechanisms underlying the established negative relationship between Jews’ presence and Holocaust victimisation. I follow a common qualitative approach of studying “typical” and “deviant” cases with contrasting values on the outcome and treatment, and different types of treatments (Dunning, 2012, 222–224; Lyall, 2015, 199-203; Seawright, 2016). Importantly, this exercise is *not* meant to establish a causal chain between my explanatory and outcome variables. While my strategy enables me to control for relevant confounders, the low number of the studied cases prevents me from holding all prewar and war conditions constant (Seawright, 2021). The “typical” and “deviant” cases are those that minimise or maximise the sizes of the residuals, i.e., in which predicted outcome, respectively, did or did not occur. They are well-suited for the study of causal pathways. The former show usual ways in which the relationship operates, while the latter—thanks to their unusually large effects—are most likely to sharply bring out the mechanisms and help uncover under-theorised sources of causal heterogeneity.

Thus, I choose six provinces that satisfy the following conditions:

1. Are “typical” or “deviant” of my theory: have, respectively, low or high residuals—i.e., minimal or maximal distances between the observed and predicted values of the outcome—the Holocaust victimisation rates;
2. Are different from one another (either A): have opposite, low and high, values on the main explanatory variable, number of insurgents per 1,000 inhabitants;
3. Are different from one another (or B): have qualitatively different types of treatment, right-wing or left-wing La Résistance groups.

G.1 Case selection method

To identify cases for comparison, I use an instrumental variable specification where units of observation are provinces.¹³ Figure G1 illustrates my approach. Using my baseline first-stage

¹³Specifically, I use a model from a previous version of the manuscript, which was updated during the later review process. One variable that this model used that does not form part of the final specification is terrain

Table G1: Overview of selected cases (copied from main text)

	Few victims	Many victims
Treatment A:	(deviant)	(typical)
low insurgent density	Somme	Gironde
Treatment B:	(typical)	(deviant)
high left-wing insurgent density	Creuse	Dordogne
Treatment C:	(typical)	(deviant)
high right-wing insurgent density	Doubs	Vosges

Figure G1: Case selection method. First-stage instrumented insurgent density and 2SLS residuals, by province

Note: Highlighted provinces are chosen typical and deviant cases. The highlighted Creuse province has 9.1 insurgents per 1,000 inhabitants and a residual of -0.404, Dordogne has 15.4 insurgents and a residual of 2.3, Doubs has 15.3 insurgents and a residual of 0.147, Gironde has 4.7 insurgents and a residual of -0.0429, Somme has 5.4 insurgents and a residual of -1.47, and Vosges has 12.6 insurgents and a residual of 1.23.

model with insurgent values instrumented through WWI military deaths, I derive a residual plot from the fully specified second stage of my instrumental variable regression. Figure G1 illustrates the relationship between instrumented number of insurgents and the second-stage outcome residuals after partialling out the effect of covariates. From among the cases, I choose pairs whose residuals cluster close to the “0” residual value (typical) and fall far from it (deviant). I thus select (see also Table G1):

1. two provinces whose predicted numbers of insurgent density is low (Gironde, Somme);
2. two whose predicted number of left-wing insurgent density is high (Creuse, Dordogne);
3. two whose predicted number of right-wing insurgent density is high (Doubs, Vosges).

To study the cases, I review the existing major historical works on French WWII insurgency in the chosen provinces and listen to French civilian and French insurgent war memoirs. How-ruggedness (Shaver et al., 2019).

ever, the quality of thus-retrieved information depends largely on the availability of such books and accounts. For example, it is easier to come across French civilian war memoirs for Dordogne than for other provinces.¹⁴ Therefore, to improve the comparability of data quality for my analysis, I listen to and code a sample of corresponding survivor testimonies from the USC Shoah Foundation and Jews' helpers testimonies from the Yad Vashem's Righteous Among the Nations Database.

G.2 Methodological approach

As specified in the article, I analyse evidence from survivors' and rescuers' testimonies (primary source data), as well as secondary sources on French insurgency.

With regards to the primary sources, I draw on the rich collections of survivor testimonies recorded and housed by the USC Shoah Foundation's Visual History Archive, and rescuer testimonies gathered by Yad Vashem Center's Righteous Among the Nations Database. I proceed in two steps. Firstly, based on the geographic indexing of those two data sources, I select all people who mention in their testimonies a locality in one of the six selected provinces (see Table G3 for selected survivors' list and Table G4 for the rescuers' list).

In the case of USC Shoah Foundation's testimonies, I am limited by my linguistic skills. I listen to interviews recorded in languages I am fluent in (English, French, German, Polish, Spanish). This forces me to discard interviews that were recorded in Armenian, Dutch, Hebrew, and Portuguese (8 percent of the total).

Secondly, I proceed to coding the interviews. I look for general context in which the province of interest is mentioned and for any mentions of insurgency. At first, my approach is inductive to work out a coding scheme that would be applicable for all survivors and rescuers, respectively. In the case of USC Shoah Foundation's records, I end up coding the following information (see Table G2 with results, copied from the main text):

- whether the survivor lives in the province in question or merely transits via the province;
- whether the survivor is captured—to identify people who are counted as “victims” in my quantitative study;
- whether the survivor mentions insurgency.

If the survivor mentions insurgency, I write down the entire passages for further interpretation. Among the passages I find out six themes: being aware of insurgent presence in the area, attitudes towards the insurgents, insurgents' attitudes towards the Jews, context in which help is offered (“material”/“moral”), being warned by insurgents, being connected with another

¹⁴See for example the website “Mémoires de résistances” <https://memoires-resistances.dordogne.fr/temoignages-audio/1008-temoignages-integraux.html> which features civilian and insurgent testimonies collected between 2009 and 2011 by the Archives départementales de la Dordogne.

Table G2: Contexts in which insurgency is mentioned in survivors’ and rescuers’ testimonies (copied from main text)

	Low insurgency		High left-wing insurgency		High right-wing insurgency	
	Gironde typical	Somme deviant	Creuse typical	Dordogne deviant	Doubs typical	Vosges deviant
<i>USC Survivor testimonies</i>	49	18	71	76	53	29
<i>Mentioning insurgency</i>	10% (5)	17% (3)	49% (35)	62% (47)	32% (17)	28% (8)
<i>Arrested</i>	18% (9)	0	4% (3)	17% (13)	8% (4)	24% (7)
<i>Transitting</i>	60% (29)	56% (10)	1% (1)	1% (1)	42% (22)	17% (5)
<i>Living 1 year</i>	2% (1)	17% (3)	45% (32)	61% (46)	6% (3)	21% (6)
<i>Hidden</i>	1 (2%)	6% (1)	7% (5)	8% (6)	0	0
<i>Warned</i>	0	0	17% (12)	13% (10)	0	0
<i>Connected</i>	0	0	13% (9)	12% (9)	2% (1)	3% (1)
<i>Smuggled</i>	0	0	45% (32)	12% (9)	25% (13)	3% (1)
<i>Received forged documents</i>	0	0	4% (3)	12% (9)	0	7% (2)
<i>Other type of help</i>	0	0	0	4% (3)	0	0
<i>Identifiably “moral” motivations</i>	—	—	11 ¹⁵	26	3	1
<i>Identifiably “material” motivations</i>	—	—	6	11	7	2
<i>YV Righteous testimonies</i>	27	0	35	63	24	22
<i>Righteous insurgents</i>	19% (5)	0	11% (4)	19% (12)	4% (1)	5% (1)
<i>Deported</i>	20% (1)	0	0	17% (2)	0	100% (1)

rescuer through an insurgent, getting one’s documents forged by insurgents, joining insurgency (see section “How and why did la Résistance help the Jews?” in the article and Appendix Section H for results).

I listen to the testimonies in the alphabetical order of survivors’ first names and I continue my data-gathering process until I feel the themes brought up by the survivors have been exhausted. My final sample consists of 168 female and 179 male survivors originally from France (111), Germany (83), Poland (29), the Austro-Hungarian Empire (20), Belgium (19), Austria (15), the Russian Empire (15), the U.S. (13), the UK (9), the Netherlands (5), Romania (4), Algeria (3), Czechoslovakia (3), Greece (3), Cuba (2), Danzig (2), Hungary (2), and one each from Canada, Italy, Libya, Luxembourg, Palestine, Switzerland, Tunisia and the USSR. In other words, most of the survivors in my sample (68 percent) are foreigner Jews. A median survivor in my sample was a teenager of 14 years old at the start of the WWII.¹⁶

Table G3: Selected sample of USC Shoah Foundation’s testimonies of survivors mentioning Creuse, Dordogne, Doubs, Gironde, Somme, or Vosges in their interviews

VHA code	Name and surname	Gen-der	Country of birth	Age in 1939	Language
CREUSE					
19787	Abram Zelazko	M	Russian Empire	27	French
13820	Aime Avniel	M	France	9	English

¹⁶In the main article I report having listened to less interviews, 296 as opposed to 347 indicated here. This is because from the main statistics reported there I discard a number of individuals who did not fulfil basic criteria for analysis. These include a few survivors who had been wrongly signposted as having resided in one of the six provinces, a few who turned out to be liberators and not survivors, and—the relatively largest group—those who were forcibly moved to a concentration camp in either of the province and could not have had any contact with La Résistance.

While a typical interview with a survivor lasts around 2 hours and the witness pool consists of 643 people, the Righteous rescuer testimonies are typically only three paragraphs-long and there are only 171 of them. This enables me to read the entire corpus of rescuer testimonies. In it, I code the following information:

- what is the status of the rescuer—insurgent/resister, civilian in contact with insurgents, civilian with no links to insurgents (see column “Status” in Table G4 for results);
- what is the fate of the rescuer—survived, arrested, arrested and deported (see Table G2 for results).

From among the rescuers who are thus categorised as insurgents (3 in Creuse, 5 in Gironde, 12 in Dordogne, 1 in Doubs and 1 in Vosges) and civilians in contact with insurgents (7 in Creuse, 2 in Gironde, 5 in Dordogne, 2 in Somme and 3 in Vosges), I note down the main themes, or contexts, in which the topic of insurgency is brought up: providing services to insurgents, being warned by insurgents, working for insurgency whilst at the same time sheltering Jews, providing Jews with specific services using insurgent networks and skills (see Section “The ‘how’” in the article for results).

G.3 Challenges to inference

There are a number of challenges to inference related to the usage of oral histories and witness testimonies in general, including memory loss, contamination of memory with political preferences and post-event official histories, the non-representativeness of the sample (too many young people in my case), and the positionality of the interviewer (interviewing organisations' positionality in my case).

First, the testimonies in question were recorded 50 years after the end of the WWII. Such time distance from the recounted events results in memory loss. The interviewee might then, even unwillingly, mis-specify certain events, or add details that were at the time not known, but only presumed. This is especially true for general opinions as opposed to personal experiences. In general, traumatic experiences—such as that of genocide—are often repressed, thus becoming inaccessible to the interviewer. In my sample I come across one interviewee who cannot recall anything about what happened to her during the war except for the fact of having been born and lived in an orphanage in Frankfurt am Main (Germany) and subsequently being hidden in a children's home in France (Sussman, 1996). In general, I restrict my focus to the analysis of situations that were personally experienced and recounted in detail by the witness, since those are less susceptible to unwilling mistakes. Moreover, from the perspective of an average Jewish civilian, the French insurgency was not seen as a direct danger or enemy, which limits witnesses' reasons to misrepresent them. The one advantage of the time distance in the context of political violence research is that the witnesses might feel less curbed by fear of retribution for recounting their experiences.

Second, another problem is the contamination of the memory with post-event narratives and political preferences. It is common to mistake second-person accounts and collectively shared beliefs about the past with one's individual memories (Kersten, 1970). For example, if it is a common belief that La Résistance let the Jews down during the war, the witness might, post factum, develop a negative attitude towards them even in the absence of personal negative experiences. Political preferences might also intervene in forming such attitudes. I find one person in the survivor sample, an insurgent of l'Armée Juive, who admits that "La Résistance did not act appropriately" ("La Résistance laissait à désirer") (Loinger, 1996), probably hinting at the lack of official pro-Jewish rescue efforts or cooperation with l'Armée Juive. While the witness might have formed this attitude during the war and for justifiable reasons, we cannot explain its foundations, since he does not give specific details about why he holds this attitude.

Third, since most of the USC testimonies were recorded in the 1990s—by which time most of the older survivors had already passed away—my sample over-represents people who were young during the war. This limits the type of experiences the survivors can speak about.

Fourth, the question I am analysing runs into a serious problem of false negatives; I underestimate the true amount of insurgent-Jews interactions and instances of help. This is because, in order to protect themselves and their rescuees, insurgents would often not reveal their true

insurgent identity or their real names. Similarly, most of survivors who were helped by rescuing organisations do not recall names of particular helping groups or individuals. If at all, they use general terms such as “la résistance,” or “le maquis,” but do not know who their helpers were, or whom they represented. I come across many such examples:

- In Doubs, smuggler Bernard Bouveret from the Vélite-Thermopyle network of La Résistance helping Jews cross to Switzerland said in a 2017 interview: “*They*[, the Jews,] *didn’t know who we were.*” (Cazzola, 2017)
- In Creuse (Bussières-Saint-Georges), Charles Strichard admits learning about the fact that his helper was an insurgent only after the war, “We took to the roads by car, but we were certainly protected by a resistance network, because a few days later we found ourselves in Creuse. (...) The mayor of Bussières (...)—*it was after the war that we learned that he was a leader of a resistance network*—he took us to a village and found us a small flat.” (Strichard, 1996, Tape 4; 02:25)
- In Dordogne (Périgueux, Négrondes), Betty Wieder also learned only after the war that a helper of her family who warned them against a raid and smuggled them to another province was an insurgent, “Apparently—*his daughter told me not long ago—her father was part of the maquis*, so he knew whether the Germans were coming or not, so he said, ‘You mustn’t stay there, I can’t keep you in the hut any longer, because there are Germans there (...) and we have to get you out’ (...) so my mother wanted to go and join my uncle in Montesquieu-Volvestre [in Haute-Garonne].” (Tape 2; 18:10)
- In Dordogne (Périgueux), David Ruzié could only speculate about how his father procured them with false identity documents, “My father’s professional contacts included someone who was involved with the Resistance. That’s all I know. *After the war it never occurred to us to ask them how they got those false papers.*” (Tape 2; 05:43)
- In Vosges (Gérardmer), Pierre Wolff was procured a false ID by a resistance group, but does not mention it in his interview either because he did not know about it at that time, or because he simply did not find it relevant to mention during the interview. I discovered this only by cross-referencing his testimony with the Righteous Among the Nations Database (see the file of Emile Duguet, M.31.2/7843).

Fifth, the testimonies are semi-structured interviews in which the interviewers ask general questions about each survivor’s war experiences in chronological order. The survivors decide what they want to recount. While all survivors are cooperative and exhaustive and the interviewers ask a lot of probing questions, the interviewers might not always ask them specific questions about the insurgency, which is the focus of my work. This means that I likely misidentify some survivors as not having had contact with insurgents, while in fact they did. Moreover, except for knowing each interviewer’s name and surname and seeing one initial

photo they take at the beginning of the interview with the interviewee, I do not know who they are and how their personal traits might have influenced the course of the interview.

The Yad Vashem Online Database of the Righteous Among the Nations testimonies suffers from being succinct and standardised. It does not recount the actual testimonies, but gives their summaries instead. This likely results in mis-identification of particular rescue testimonies as unrelated to insurgency. Likewise, in cases of rescuers who were given the title posthumously and their rescuing acts were recounted by their rescuees, we might not learn about their or their circle's insurgent activities who might have been hidden from the rescuee during the war. The one advantage of the database is that it consists of testimonies gathered for decades, since the 1950s, so it does not suffer from as many problems of memory loss, post-event contamination, and the sample's lack of representativeness as the later accounts.

Despite these flaws, witness testimonies are important and often the only source of information about micro-level events such as rescuing and, in general, personal relationships during the war. Such oral and written testimonies have been successfully used in other scholarly works researching political violence (from among the works cited in this article see, e.g., Bańkowska et al., 2005; Gross, 2001; Kalyvas, 2006; Kedward, 1993; Petersen, 2001).

H Additional qualitative results

17

H.1 Description of left-wing Creuse and Dordogne

Thanks to Creuse’s and Dordogne’s non-strategic geographic position,¹⁸ favourable mountainous terrain, and of “a culture predisposed to dissidence,” La Résistance formed very quickly there (Souleau in Marcot, 2006, 269; Marcot, 2006, 289). Relatedly to my causal instrument, WWI military deaths, Creuse’s and Dordogne’s inhabitants felt particularly impacted by WWI due to the death, respectively, of 4.7 and 3.7 percent of its male inhabitants on the war’s fronts (Archives départementales de la Dordogne, 2023, 1 M 76; Geneanet, 2023; Guyoton, 2018; Yagil, 2010, 100). Creuse subsequently developed a strong antagonism towards both the national French state administration and Germany (Yagil, 2010, 100). Similarly, starting in 1917, Dordogne’s population protested repeatedly against the war’s human and economic impacts (Archives départementales de la Dordogne, 2023, 1 M 76). The impact of the WWI atrocities on local collective memories is evidenced with a very high number of monuments to the dead soldiers in the form of commemorative plaques, erected in the 1920s in each municipality of both provinces (Geneanet, 2023; Guyoton, 2018). This gave rise to particularly high insurgent enlistment in WWII. The main groups operating in these two provinces belonged to the centre-left Armée secrète (AS) and the communist Francs-tireurs et partisans français (FTP) organisations (Service historique de la défense, GR 19 P). Due to a very high insurgent density of Creuse and a high presence of foreigner insurgents among La Résistance’s local ranks—especially Italians and Spaniards—the occupying forces called it “the small Russia” (Parrotin, 1997; Parrotin, 1998; Plas in Marcot, 2006, 290).

H.2 “Moral” motivations among left-leaning groups (full results)

Three survivors in Dordogne and one in Creuse mention the antipathy towards the Germans as a reason for engaging in helping activities (Table 1, “structural balance”). Survivor Pierre Chanover (1995, Tape 3), hidden by underground members Madame Rosier and her son in Sainte-Foy-la-Grande (Dordogne), speculates that the sentiment was provoked by the experience of WWI, “Madame Rosier’s husband died in WWI—was killed in the war. And she had

¹⁷All quotes have been translated from French or Spanish by the author.

¹⁸The relative safety of Creuse was known and prompted Jews to seek shelter there. Gerda Bikales (1998, Tape 7; 28:02) explains: “We knew someone and followed the lead of this person. (...) This village[Saint-Hilaire-le-Château in Creuse] was very remote (...) it was in a very poor region of no interest. There weren’t many Germans there, nothing to go after (...) We went there because it was uninteresting, isolated and poor and surely wouldn’t attract the authorities (...) and so there were quite a few Jews living in that part of France.” See also Baur (1997, Tape 2; 06:25). In Dordogne, the flux of Jewish population was due to the housing availability which prompted the French administration to relocate there its Alsatian population on the eve of the German invasion (Reviriego, 2003, 17-20).

no love for the Germans. And the actions that she took [had] always something to do against the Germans.” Noteworthy, survivor Solomon Goldman hiding in Évaux-les-Bains (Creuse) thinks that such antipathy did not necessarily translate into a lack of antisemitism.¹⁹ Two further accounts implicitly highlight the importance of WWI experiences and anti-German feelings.²⁰

Three cases in Dordogne give evidence of “moral imperative” or “empathy/compassion” motivations. One of them relates to the case of a partisan priest in Mézérac who tries to persuade the local population to be more helpful towards the hiding Jewish refugees,

“The baker had his days off. We couldn’t buy bread. (...) The farmers (...) didn’t want to sell any. One of us went to see the priest one day and said, ‘Listen, you know who we are, we’re refugees from around here (...) We’ve got a problem with bread.’ (...) The priest gave a sermon on Sunday morning (...) now when I think back on this story I say to myself that it’s just as well that he didn’t say that Jesus Christ was a Jew, because that wasn’t a common idea at the time. (...) But he said that all men are brothers and sisters, (...) that the refugees should be able to eat like everyone else. (...) The priest was obviously part of the resistance. (...) So we got bread.” (Ermantier, 1997, Tape 2, 22:20)

The case suggests that, beyond the direct assistance which I propose in this article, insurgents who are leaders in their communities could affect local attitudes towards the genocide targets.²¹ Another example of either “moral imperative” or “empathy/compassion” motivation comes from Manzac-sur-Vern, where the underground murdered a pedophile priest who collab-

¹⁹He recalls, “The people were people that resisted the Germans (...) a well-chosen area (...) One of the things that my father always told me, and one of the reasons why he never really gave recognition to these people to the Yad Vashem (...) the most comment that came from these people, over and over again, was that we’re not doing it because we love Jews. We’re doing it because we hate Germans more than we hate Jews. (...) and that didn’t leave a wonderful taste in your mouth” (Goldman, 1995, Tape 1, 28:00).

²⁰Survivor Nelee Langmuir was smuggled to Thiviers (Dordogne) by a WWI veteran who had a permit to cross the demarcation line thanks to his business: “Albert Béraud (...) had a shoe factory. He helped many families cross the demarcation line. (...) He was a wounded veteran from WWI (...) and he was the head of the underground of that area. (...) He helped a lot of people in that town. He delivered shoes to people, sometimes food” (Langmuir, 1997, Tape 1, 46:00, 1:28:39). Among insurgents’ testimonies, I find rescuer Marie-Josèphe Devaux from Milhac-d’Auberoche (Dordogne) whose whole family was active in the underground. They lived and sheltered Jews in a farm that was a property of a family who lost their son in WWI. Her great-uncle was a WWI veteran (Devaux, 2009).

²¹Similarly, a resistance mayor in Creuse helped Charles Strichard’s family to get settled in his village: “We took to the roads by car, but we were certainly protected by a resistance network, because a few days later we found ourselves in Creuse. (...) The mayor of Bussièrès (...) was also the headmaster of the school that took us in. It was after the war that we learned that he was a leader of a resistance network. He took us to a village and found us a small flat. I remember he got the whole village together (...) to tell them that we were under their protection. (...) I think these people had never seen Jews and didn’t want to believe that we were Jews” (Strichard, 1996, Tape 4, 02:25). Among civilian memoirs I find that of Fernand Sabouret who describes a similar case of a local school teacher who initiated the Resistance in the Vergt (Dordogne) region. He built a smuggling network between the Occupied and Unoccupied zones: “Pierre Larue, a Resistance fighter, brought us [to the village] a Jewish family, the Drucker family, who were housed in a neighbouring farm which was free and stayed until the liberation in 1944. (...) Larue came to tell us that we had just rented the house to a Jewish family. ‘They’re going to come and buy food from you, but don’t worry, they’ve got enough to pay for it’” (Sabouret, 2009, 04:00).

orated with the Germans. He would abuse the Jewish children under the pretense of helping, subsequently passing them on to the German police (Créange, 1997).

A further 14 people in Dordogne and 37 in Creuse are helped in ways which clearly do not involve material benefits. For example, at their arrival to Anzême (Creuse) in 1943, Denise Attia (1997, Tape 2, 15:15) and other three Jewish families are offered ration coupons by the mayor who was part of a communist underground. Similarly, a police officer in Guéret (Creuse) refuses to register Gisele Israel (1997, Tape 3, 16:30) and her family as Jewish:

“We went to register [on arriving from Paris] (...) [, but] we never got a ‘Jewish’ stamp, because the police officer in Guéret who was in the Resistance said, ‘Your name doesn’t tell me anything, I won’t stamp you.’ It was Monsieur Saintoire (?) whose family helped us a lot, they were very, very good people.”

In the secondary literature, I find the case of a tuberculosis sanatorium in Brantôme (Dordogne) managed by members of the underground group Nestor, Pierre and Marguerite Bouty, who hide Jewish children in partnership with the Jewish organisation OSE (Archives départementales de la Dordogne, 2023, 14 J 33; Yad Vashem, 2021, M.31.2/11093).

Additionally however, among the testimonies from Creuse and Dordogne I find 17 indications of insurgents’ “material” motivations. Thus, in six cases in Creuse and four in Dordogne, resistance groups relied on Jews’ help due to their targeted status (“compromising information”). For example, Fanny Ben-Ami (1996, Tape 2; 04:40) who hid in Creuse as a teenager recounts how she was recruited to a local insurgent branch and tasked with providing the partisans living in the forest with food:

“I met a man with a rifle. I was really afraid of him. And then he says ‘You’re a small Jewish,’ to which I respond ‘No, I’m not Jewish.’ ‘Yes, you are, I know you are Jewish, you [and your family] are refugees.’ And so I look at him and say ‘Yes, and you are the insurgents’ because insurgents and Jews I knew were the same thing, they defended one another. (...) ‘Would you be ready to fight against the Germans?’ ‘Yes,’ I said, ‘I don’t like the Germans either.’ ‘OK then. I think I might need you.’”

We witness a negotiation of cooperation. The insurgent assumes that, by approaching a Jewess, he is running low risks of mistakenly approaching a collaborator. Ben-Ami on the other hand ends up revealing her true identity, because she discovers she can use the information about her interlocutor’s true identity against him as well.²² She motivates her availability to cooperate on the basis of their shared dislike of the Germans.

²²Similarly, Amelie Rauner (1997, Tape 3, 01:25) in Périgueux (Dordogne) is referred to a job by a partisan who is very insistent she accepts the offer: “They were aware of my Jewish identity, that’s one of the reasons why I got the job. (...) ‘What do you mean by that?’ ‘Well, because I wasn’t going to denounce them to the Germans, because he was working for the underground’ ‘Was it clear when you applied for the job?’ ‘The only thing she said was just that she couldn’t just have anyone in the house. Which had a lot of meaning in those days. (...) I wasn’t aware of that hidden meaning back then, not after three days later.’”

Other seven “materially” motivated cases involve insurgents recruiting Jews to their networks (Marcus, 1996), relying on Jews for food provision (Israel, 1997; Lastmann, 1996; Tenen, 2001), medical treatments (Tenen, 2001; Jean and Cécile Audoin Yad Vashem, 2021, file M.31.2/12027), knowledge of foreign languages to decipher communication in German and Russian (Rencus, 1995; Tenen, 2001), and hideouts for themselves, their guns and ammunition (Cywiakowski, 1997; Regensberg, 1997; Tenen, 2001).

H.3 Description of right-wing Doubs and Vosges

Doubs and Vosges provinces struggled with a long history of antisemitism (Pinard, 2002, 57-77). In 1898, during the Dreyfus affair, the two provinces broke out in antisemitic riots (Wilson, 1973, 790-791). After WWI, Jews in Doubs would be routinely confused for German allies, because of their other-sounding surnames (Vauthier, 2018, 109; Pinard, 2002, 63-66). The antisemitism grew even fiercer in the light of the interwar economic crisis and the 1936 parliamentary elections which gave majority to the socialist coalition (Pinard, 2002, 66-71; Marrus and Paxton, 2019, 23-29). After the 1940 annexation of the Alsace-Lorraine region by Germany, both provinces found themselves in close proximity to German and Swiss borders. The most represented insurgent groups active in the regions belonged to the AS and three apolitical movements that united ex-military personnel: Organisation de résistance de l’armée (ORA), Organisation civile et militaire (OCM), and Ceux de la Résistance (CDLR) (Service historique de la défense, GR 19 P).

H.4 “Material” motivations among right-leaning groups (full results)

The type of help activities represented in the sample were most likely short-term and payable (“financial” motivations). Thus, in Doubs, all Jews who were helped were either smuggled (13 or 25% of the sample) or contacted with smugglers (1 person or 2%). Four specified paying for the service. Frederique Epstein (1996, Tape 1, 23:08) from Besançon (Doubs) recounts: “We left via Dole, the zone that was still occupied. There were SNCF smugglers working with the maquis.” Her sister, Suzanne Gibersztajn (1996), specifies that their mother paid 15,000 French francs for the journey.²³ In Vosges, comparatively less people are helped: two (7%) receive false documents, one is smuggled and one is connected with a trustworthy civilian helper. From among these Vosges accounts only one, Pierre Wolff (1997, Tape 2, 14:05), implies that his insurgent rescuer procured him the false documents for free.

Two survivors from Doubs recount being recruited to resistance groups because of being Jewish (Table 1 in the main article, “compromising information”). While both groups recruited them outside of Doubs, they had contacts in the region. Francis Levy (1996, Tape 2, 15:50) recounts:

²³See also interviews with Liba Eloit (1996) and Israel Reingewirtz (1995).

“He [the doctor] said to me ‘I know what you’re here for (...) I imagined that with your surname you were going to try to find me.’ I thanked him very much for the gesture he made to me, I said, ‘The truth is I wasn’t expecting so much.’ (...) He said, ‘Yes, but this has a cost. (...) Now you are going to work for us.’ I found out later that the doctor was one of the leaders of the resistance in the Lyon area. So was his wife.”

In 1944, Levy arrived to and fought in Besançon together with his resistance unit. Similarly, Israël Sieradzki was smuggled through Doubs by a resistance network,

“You’ll be able to join the resistance. I said ‘OK’ (...) I didn’t want to be subjected to Hitlerism, to Nazism. (...) So I was guided. (...) One group said to me, ‘We’re in the resistance, we know you’re Jewish (...) we’re going to give you a route [to escape to London and join De Gaulle].’ This group made me leave, they gave me a piece of paper, the writing where I should go. They told me that my destination was Besançon and that’s where [we travelled to escape to Switzerland]” (Sieradzki, 1996, Tape 3, 05:00).

I find only three accounts from Doubs that suggest “moral” considerations could have motivated insurgents to help. For example, Wolfgang Stimler (1996, Tape 2, 22:10) recounts how smugglers who had fought in the Spanish Civil War with International Brigades helped them cross from Pontalier to Switzerland and even invited another Jewish family of five to join them. Additionally, in the secondary literature, I find three escape networks from Doubs that most likely required payment for their smuggling services, but were at least partially motivated by “moral” considerations. Thus, resistance network Vélite-Thermopyle composed of 15 smugglers is believed to have smuggled as many as 200 Jews through the Doubs-Swiss border (Besson, 1998, 148-149; Tuailon-Nass, 2015, 283). One of their members, Bernard Bouveret from Chapelle-des-Bois, is motivated by his antipathy of the Germans (“structural balance”):

“First of all, we didn’t like the Germans. We’d been told we were the strongest army in the world, and within a week the Germans were all over France. Even though we were kids, we weren’t proud of that” (Simon, 2020). “Resistance fighters were easy enough to get across the border. The Jews were a different matter,” he remembers, “We passed families of ten or fifteen people. We carried the children on our shoulders. People were scared. So were we.” (Cazzola, 2017)

Another example is the parish church in Montbéliard, which is used as a safe house for escape routes. Jean Flory, a Catholic priest at the parish, chaplain in WWI and member of the resistance in WWII, was likely driven by “moral imperative” or “empathy/compassion” when he put a yellow star on the Jesus in the cot at Saint-Maimbœuf church in December 1942 to remind the population that Jesus was a Jew (Marcot and Baud, 1985; Marcot, 2006, 283).²⁴

²⁴Similarly, Alsations Paul Koepfler and Jean Eschbach found a network that furnishes false papers and smug-

H.5 Network: Insurgents recruit civilian helpers (full results)

Other survivors who mention being connected with rescuers through insurgents involve Fernand Levy (1997, Tape 3, 15:00), who gets acquainted and hidden by Grenouillet family in Dordogne, recommended to him by a partisan. Similarly, four Righteous insurgents (two in Dordogne, one in Creuse, one in Vosges) help arrange shelter for their rescuees. For example, Paul and Julienne Boucher, friends with members of communist insurgents hid twelve Jews in Saint Pierre de Fursac in Creuse:

“David [Frenkiel] had befriended several communist railway workers. Through these friends, he became acquainted with Paul and Julienne Boucher, who owned a farm in Crachat. When the Germans invaded [Béziers] in 1942, the Bouchers invited the extended Klap family to stay with them” (Yad Vashem, 2021, file M.31.2/12036).

H.6 Skills: Insurgents forge documents and organise evasion (full results)

Other noteworthy examples related to the document forgery include one from among the insurgents’ testimonies and one in the secondary literature. Among insurgent testimonies I find that of Jean Vergnon who joins the resistance and infiltrates a local police station in Bergerac (Dordogne) together with two other friends. Their strict goal is to forge documents for the persecuted people: resisters, Jews, Alsations, Communists (Vergnon, 2009, 03:10). In the secondary literature I find the description of a resistance network around the mayor of Périgueux (Dordogne)—Marguerite Eberentz, Georges Lanard and Hughes Pierre Puyjarinet—who, among other activities, provided local Jews with false papers (Reviriego, 2003, 166).

Regarding evasion, the following story of Blanchet family (Yad Vashem, 2021, file M.31.2/4769) evidences how cross-border escape routes were used to assist different persecuted or vulnerable groups:

“Georgette Blanchet and her three brothers (...) lived in the unoccupied southern zone of France near the demarcation line. They all (...) belonged to a rescue network used by Resistance members to move escaped prisoners and mail to the southern zone. The transfers occurred at night in a boat that crossed the Creuse River. They had to evade both the German police, who patrolled the northern bank round-the-clock, and the French gendarmes, who patrolled the opposite bank. (...) [T]his network (...) saved many Jews.”

gles people—including Senegalese PoWs and Jews—across the demarcation line (Besson, 1998, 120-121). It is possible that their minority identity is what motivated them to help other minorities (“empathy/compassion”).

On top of the “Circuit Garel” network described in the main article, in the secondary literature I find another organised smuggling network of refugees and Jews led by Marcel Philippe Arburger, one of the founders of the underground in Vosges (Pennetier et al., 2015).

H.7 Counterinsurgency and reprisals in provinces with many Jewish victims: “deviant” Dordogne, Vosges, and “typical” Gironde

In the counterinsurgency campaigns, which were directed ostensibly against the insurgents, Jews became substitute victims whenever insurgents could not be located. Thus, in anti-insurgent reprisals in Dordogne in October 1943, in the Spring of 1944 (reprisals by the Brehmer division) and in the summer of 1944, scores were deported and at least 214 were murdered—the highest number of Jews’ executions in the whole of France (Pennetier et al., 2015; Marrus and Paxton, 2019, 270; Penaud, 2004; Reviriego, 2003, 227-262). One of the arrested resisters who worked at the police station of Bergerac is Jean Vergnon, mentioned in the main text. He is arrested on June 26, 1944 for forging documents for persecuted ethnic and political minorities and insurgents. Jeanette Lichtenstein, an Auschwitz survivor hiding in La Bachellerie (Dordogne), explains the indiscriminate logic of anti-insurgent reprisal violence:

“In a village that was a bit on a (...) hill. It was cut off from the main road. It’s important because if it hadn’t been for the maquis and the collaborators, I think we’d have been spared and we’d have stayed in this village right to the end. (...) My father was able to do his job, we stayed there for four years and I put on 10-15 kilos, which would be important later on. (...) The Germans who arrived—these were reprisals—because an officer (...) was a collaborator and the maquis kidnapped his wife (...) and so because there was this ‘maquis-and-collaborator’ incident, the Germans arrived in this village on a denunciation and settled there. (...) The gendarmerie gave them a list of all the Jews and so they were able to go to everyone’s house. (...) So at the time of the arrest [in April 1944], all the males were shot, even two boys, one aged 13 and the other 14, on the spot. And as my father had come forward, he was shot. (...) Before the incident, the Germans didn’t even know we existed, because the road was quite far away” (Lichtenstein, 1996, Tape 1, 10:10, 13:00, 15:20).

Vosges, due to its geographical position in the East of France, was one of the provinces that experienced the war the earliest and that took the longest—until February 1945—to liberate. Marcel Philippe Arburger—mentioned in the main text—was one of the initiators of the underground in Vosges. He organised the clandestine passage of refugees and Jews to Switzerland. In late 1943, he is arrested in a counterinsurgency raid and executed (Pennetier et al., 2015, Article 149102). Survivor Erika Nieder recounts the effect of reprisals during her flight from Épinal (Vosges) in June 1940:

“We were told that just the day before the activity of the resistance occurred. They blew up the headquarters of the Germans by the demarcation line and that [the Germans] would be rather ferocious. But very luckily as our train rolled into the station, (...) the Germans were busy checking the papers [of other refugees going to Belgium]” (Nieder, 1995, Tape 1, 21:00).

The occupiers’ presence and territorial control of Gironde was very high during the entire occupation period. With its capital in Bordeaux, Gironde was the naval submarine base of Germans and Italians from where the Axis powers engaged in the Battle of the Atlantic that spanned the entire occupation period. The province is moreover geographically close to Spain, a mostly neutral country in the WWII conflict, through which many politically vulnerable groups sought to escape to Allied countries. The demarcation line that crossed the province between 1940 and 1942, separating the occupied north from the “free” Vichy south, was yet another reason for a high state presence in the province. The occupiers’ capacity for inflicting violence became otherwise quickly painfully blatant as Souges Camp near Bordeaux became a site of mass reprisals against insurgents: 300 are estimated to have been executed during the occupation (Souleau in Marcot, 2006, 268–269).²⁵

²⁵For the full list of the executed see the official webpage of the *Association du Souvenir des Fusiliés de Souges*: <https://www.fusilles-souge.asso.fr/les-fusilles/>.

I Scope conditions (extended discussion)

In this section I discuss in more detail the two scope conditions I mention in the main article, (1) the importance of inclusive ideologies and (2) the limiting effects of the extraordinary state targeting. The first condition makes the theory most applicable to genocides where either left-leaning or coethnic insurgents are present. The second condition suggests that given the increased victimisation during times of extreme targeting, the theory is most applicable to longer-unfolding genocides where the weak actors (insurgents and genocide targets) have time to adapt their response strategies to the realities of the persecution. I contrast these two conditions with evidence from other genocides.

Firstly, insurgents harbouring inclusive ideologies exhibited higher rates of “moral” motivations and were the most likely to help the persecuted. Most probably, inclusive ideologies are therefore more likely than exclusive ones to increase insurgent assistance. This interpretation could explain why “deviant” provinces with high insurgent density exhibited more extreme but directionally similar behaviour to their ideologically “typical” counterparts. The insurgents in the “deviant” left-wing province, Dordogne, assisted the Jews even more than insurgents in the “typical” left-wing Creuse. Conversely, the insurgents in the “deviant” right-wing province, Vosges, assisted the Jews less than insurgents in the “typical” Doubs. This interpretation is also supported by the quantitative results, since my instrument is more likely to isolate the effect of the “moral” insurgents; those who joined La Résistance out of anti-German sentiments would have been more likely to support Jews out of “structural balance” motivations.

In Poland, left-wing socialist and communist insurgent groups and individuals were more likely to help Jews than their right-wing counterparts. Some nationalist Home Army (AK) units from rural regions of Eastern Poland regarded Jews as a Soviet enemy and would even murder hiding Jewish civilians (Zimmerman, 2015, 267-298).²⁶ Conversely, socialist and communist partisans from the same regions—e.g., Polish People’s Army (PAL) and GL/AL—would assist the Jews in hiding and admit them into their ranks (Bańkowska et al., 2005, 159-164). Polish government in exile, the executive arm of AK, sponsored *Żegota* network which helped Jews hiding in Warsaw, Cracow and Lwów. Among its many feats, it forged 50,000 *sets* of false documents and connected many with trusted Polish rescuers (Zimmerman, 2015, 306). However, the Polish Secret State could have acted on “material” incentives when establishing the network by seeking to use *Żegota* for its propaganda abroad: “saving human lives (...) was not their most important goal” (Uryniewicz, 2006, 224) (“reputational” motivation in Table 1, main text). At any rate, the *Żegota* helpers working on the ground were members of left-wing parties and most of them were Jewish (Uryniewicz, 2006, 239). They acted on identifiably “moral” motivations. For example, Irena Sendler—a member of the Polish Socialist Party who smuggled 2,500 Jewish babies and children out of the Warsaw ghetto—said to have acted on

²⁶This feeling was reciprocal. Jews regarded nationalist Polish partisan units as “an enemy equally dangerous as the Germans” (Ainsztein, 1974; Bańkowska et al., 2005; Gutman and Krakowski, 1986; Krzyzanowski, 2020).

ethical grounds (Skinner, 2011). Another well-documented large-scale assistance to 250 Jews by AK took place in Hanaczów near Lwów. The unit likely acted on “moral” motivations as well; since the region was majority-Ukrainian, it would have been possible for minority Poles to empathise with the Jews (Zimmerman, 2015, 314-317) (“empathy” motivation in Table 1, main text).

Secondly, presence of insurgents was helpful to the targeted group only for as long as the state did not strategically target those regions. In the French case, the studied “deviant” provinces were exposed to higher levels of persecution of partisans and Jews, and to indiscriminate violence against civilians during the volatile beginning and end of the occupation (1940 and 1944). The highest proportions of survivors from my sample who were arrested and deported to Auschwitz were from Dordogne (17%), Vosges (24%), but also from the “typical” Gironde (18%), where insurgent density was low.²⁷ This reconciles my findings with previous studies of insurgency in civil war and means that the positive impact of insurgents on the survival of the persecuted is more likely to transpire in longer-unfolding genocides such as that of Armenians in the Ottoman Empire and less likely in short, high-intensity genocides such as the one in Rwanda.

The Rwandan genocide took only 10 days to engulf some 80 percent of all of its victims (Straus, 2006, 57). It would have therefore been impossible for the Rwandan Patriotic Front (RPF)—the Tutsi rebel troops—to react on time. Noteworthy however, the only commune where the genocide did not take place was Giti, where the RPF insurgents arrived just before the onset of violence in the rest of the country: “If the *Inkotanyi*²⁸ had not arrived, there would have been massacres,” believed a survivor interviewed by Straus (2006, 87). In contrast, the Armenian Genocide spanned almost two years. There, Kurds of Dersim—who were not insurgents strictly speaking, but who lived in opposition to the central Ottoman government and in full control of their mountainous territory—helped to smuggle and shelter up to 15,000 Armenians fleeing villages from the 100 km radius.²⁹ Being a minority themselves they could have acted on “moral” motivations, especially because they saved some Armenians for free. However, we also know that they did require payments from most (Kévorkian, 2011, 421-422; Suny, 2015, 322-323).

²⁷All three experienced heightened counterinsurgency campaigns. See Appendix Section H.7 for more details.

²⁸A synonym for the RPF.

²⁹See also the case of Musa Dagh insurgency in Çiçek (2020).

J Alternative model with Jewish insurgents

In this article, I tackle the question of whether non-coethnic insurgents get involved in helping genocide targets. As part of my empirical strategy, I exclude the Jewish insurgents from the main explanatory variable and control in my models for Jewish community presence (1942 Jewish census and the presence of a synagogue). This approach is meant to serve as a harder test of my theory. It is motivated by the wish to isolate the effects of the insurgency (and what insurgency entails) from the effects of coethnicity (and what it entails). In other words, I am interested in learning whether the technology of insurgency (the skills, etc.) has a detectable effect on the survival of another group even in the absence of the urge to help one's community. The positive effect of coethnic insurgent presence on their group's survival could have been considered obvious.

The theory however does extend to coethnic insurgents. This is because the coethnic insurgents should be even more likely than non-coethnics to help for "moral" reasons, specifically "empathy" (main article, Table 1). In the studied context, high Jewish presence among French insurgent ranks must have motivated additional acts of help. This is especially so, because most of those Jews were left-leaning.

To find out whether their presence did indeed increase the incidence of help and, if so, what the size of the difference is, I run additional models that include Jewish insurgent actors in the main explanatory variable. According to the results reported in Table J1, if we include the Jewish insurgents in the main estimation—as compared to the baseline results reported in the main article—a one-percent increase in the density of insurgents leads to between 61 and 85³⁰ more people saved on the level of the country.³¹ These results prove the intuition that coethnics will be likely to extend a helping hand to the civilian targets of violence.

³⁰The coefficients of 0.855 and 1.245 percent relate to a mean number of 75 Jews in a county; $75 \times 0.00855 \times 2912$ units of observation = 1867.32 (vs. 1782.144 in the main reported model); $75 \times 0.01245 \times 1945$ units of observation = 1816.144 (vs 1754.876 in the main reported model).

³¹See Table J2 for alternative specifications of the dependent variable that yield very similar substantive results.
